eye disease. 100ug of total RNA was used for library construction. A directionally cloned CDNA library in the pSPORTI vector (Life Technologies) was constructed at Bioserve Biotechnology (Laurel MD) essentially following the protocols of the SuperScript Plasmid System full details of which are contenied in the manufacturer's Instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 167 TCGTCCACCATCAGCCCCTACTACCGCCAGTCCCTCTTCCGCACCGTGCTGGACTCCGGC 226

/dab_host="EMDH10B"
/clone lib="Mouse Whole eye, unamplified: io/ip"
/clone lib was constructed at Bisserve Biotechnology
/claurel MD) essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's Instruction manual
/chtp://www.lifetcch.com/). First strand synthesis was carried out using a Not I primer-adapter
/cloned in Not I/Sal I sites. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."

total RNA was extracted from 200 adult mouse whole eyes. A
directionally cloned cDNA library in the pSPORT1 vector
(Invitrogen) was constructed at Bioserve Biotechnology
(Laurel MD) essentially following the protocols of the
SuperScript Plasmid System full details of which are
contained in the manufacturer's Instruction manual
(http://www.lifetch.com/). First strand synthesis was
carried out using a Not I primer-adapter
[5-pGACTAGTTCTAGATCGCGAGCGGCCCC(T)15-3']. CDNA was
cloned in Not I/Sal I sites. EST analysis was performed on

/note="Organ: Bye; Vector: pSport1; Approximately lmg
total RNA was extracted from 200 adult mouse whole eyes. A
directionally cloned cDNA library in the pSPORT1 vector
(Invitrogen) was constructed at Bioserve Biotechnology
(Laurel ND) essentially following the protocols of the
SuperScript plasmid System full details of which are
contained in the manufacturer's Instruction manual
(http://www.lifetech.com/). First strand synthesis was
carried out using a Not I primer-adapter
[5'-pGACTAGTTCTAGATCGCGAGCGCGCCC(T)15-3']. cDNA was
cloned in Not I/Sal I sites. EST analysis was performed on
the unamplified library at the NIH Intramural Sequencing
Center (NISC)."

/note="Organ: Eye; Vector: pSport!; Approximately Img
total RNA was extracted from 200 adult mouse whole eyes. A
directionally cloned cDNA library in the pSPORT! vector
(Invitrogen) was constructed at Bioserve Biotechnology
(Laurel MD) essentially following the prococols of the
SuperScript Plasmid System full details of which are
contained in the manufacturer's Instruction manual
(http://www.lifetech.com/). First strand synthesis was
carried out using a Not I primer-adapter
[5'-pGACTACTTCTAGATCGCGAGCGCCC(CT)15-3']. cDNA was
cloned in Not I/Sal I sites. EST analysis was performed on
the unamplified library at the NIH Intramural Sequencing
Center (NISC)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     115 caachefreaaccagherreagcaagageerriffaaghacaacchgereere 174

total RNA was extracted from 200 adult mouse whole eyes. I directionally cloned cDNA library in the pSPORT1 vector (Invitrogen) was constructed at Bioserve Biotechnology (Laurel MD) essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's Instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I primer-adapter (5)-pGAATGTICTAGATCGCGAGCGCCCCT)15-3']. CNNA was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           103

The crystallins contribute 90% of the soluble lens protein and are highly conserved during evolution. There are four immunologically separate classes of crystallins called alpha-beta-, gamma-, and delta-crystallin. The mRNA of the alpha-A-crystallin from mouse, like that from cows and rats, is nearly three times the size required to code for the polypeptide. Nucleotides 1-490 of the mouse alpha-A-crystallin mRNA predict a protein sequence identical to amino acids 10-173 of rat alpha-A-crystallin.

The absence of the long 3'-non-translated region in mRNA coding eye lens alpha A2-crystallin of the frog (Rana temporaria)

FEBS Lett. 162 (1), 47-51 (1983)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           in
                                                                                                                                                                                                                              Primary structure of cloned cDNA coding alpha-A2 crystallin of eye lens of the frog Rana temporaria
Dokl. Biochem. 271, 277-280 (1984)
Data kindly reviewed (05-11-1985) by S.I. Tomarev
Sequence 1 to 185 is complementary to sequence 553 to 369 and probably a cloning artefact; amino terminal amino acids are missing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SerGluValArgSerAspArgAspLysPheValIlePheLeuAspValLysHisPheSer

This CDS clone is a part of a collection of human full length
expression clones generated by BD Blosciences Clontech and the
expression clones generated by BD Blosciences Clontech and the
farvard Institute of Proteomics. Each CDS has been cloned in two
forms: with and without stop-codon (to allow fusion with C-terminal
tag). The CDS has been directionally cloned using BD In-Fusion(TM)
cloning system between the SalI the clone: 'ACC' after SalI sites
and before 'ATG' to provide Kozak consensus sequence; 'GG' after
last codon and before HindIII site to maintain reading frame.
